Abstract: For teaching English the Web is an endless resource of study material and a useful tool for communicating. This goes especially for Business English, as most of the business letters are sent by e-mail and it is common to have international business meetings using videoconferencing programs on the Web. The purpose of this poster is to present an action research on the use of the Web in language teaching, and also to demonstrate the Web design of Business English course in Pori School of Technology and Economics, Finland. The experiences from the pilot project in August-October 1999 are described comparing two study groups. The first group consists of part-time M. Sc. students that participate in the Web course, and the second group of full-time students that participate in normal classroom tuition. The results are shown, aiming at giving some advice for the design of future language courses on the Web.
