Creating Computer Based Learning Artefacts For Implementation In The
United Kingdom’s National Grid For Learning As A Third Year
Interactive Multimedia (BA Hons) Degree Project.

Abstract:

This poster session is designed to showcase how students enrolled on a BA(Hons) course in Interactive
Multimedia can participate in a government educational initiative (the UK’s National Grid for Learning) while
fulfilling degree requirements. The Web based work that the students developed demonstrates how the concept
of a national educational resource can be used in teaching and learning for all levels of education.

From an instructional point of view the project was an excellent one that allowed students to control a ‘real
world project’ and at the same time be involved in teaching the use of interactive multimedia to a teaching
professional. Technology students tend to forget that the rest of the world isn’t as technically ‘savvy’ as they
are. This brief forced them to step back and take a look at the user population.
