Abstract:

The usage of videos has increased in the educational realm due to many factors, one being that they can be more personal and engaging to the viewer. The multi-media world is moving rapidly forward and educators need to embrace these changes and adapt their methodologies accordingly. Research has shown that many students disregard written feedback provided by their teacher; however, educators continue to spend hours providing only written feedback to their students. Current research has shown that the usage of video-based feedback has proven to engage students in the feedback loop as students are not as quick to disregard this type of feedback. In this session participants will learn about different video feedback software and their usages. A step-by-step handout will be provided for the participants to be able to use video feedback software efficiently once they return to their classrooms.
