The use of student response systems in traditional classrooms has increased in recent years. Coupled with the increased use of mobile devices on campus Griffith University saw an opportunity to implement a mobile polling solution that could solve some the problems associated with traditional clicker devices. This paper will discuss the experiences at Griffith University in implementing a polling tool using students' own mobile devices. A discussion on the uptake and usage within the University and across other Australian universities will also be provided along with future plans to make the tool available to interested parties.
