Smartphones and tablets offer the means of putting surveys and quizzes directly into the hands of learners. Using current technology, you can deliver a single assessment to different types of devices and have the results processed centrally. What tools and processes do you need? What are the most practical applications for mobile assessments, and how can they be used in conjunction with more traditional assessments? This presentation will show how to use mobile assessments on their own or as part of a blended delivery strategy to give learners retrieval practice, gather their opinions or test their knowledge while they are on the move. It will identify some key applications for mobile assessments, including surveys, quick quizzes, mobile testing “centers” and observational assessments. It will also explain best practices for creating surveys and quizzes that are most appropriate for mobile delivery, taking into account limitations on screen size, typing capabilities and bandwidth.
