The German Institute of Scientific Film (IWF) is a scientific-media service provider. The IWF's service is primarily intended to serve the research and educational communities. It now presents an interactive program, offering a unique and rich multimedia experience: The Cell I - Life from Light an Air. It focuses on the cell - the basic structural unit of living matter. The smallest morphological unit in any organism. So complex, that it cannot be represented with the medium of the classic textbook, but only with state of the art multimedia. In the CD-ROM, you can study living cells, use a virtual microscope, come into a virtual laboratory, perform the key experiments in biology, search for missing molecules, fly through cells and explore Virtual Reality in the microcosm. Our website cells.de offers science news, evaluated links to other internet resources and access to the world's largest library of cell-biological videos.
