The use of computer technology has changed the research, education and teaching. The use of www became a very useful educational tool and especially in a distance learning system. In the Department of Education we taught the 'Introductory Statistics course for the Social Sciences' using the www.

All students who entered this course had the availability of a PC and Internet access. The course material was in the www. Moreover, a list of books was given to all students at the beginning of the course. We used cooperative learning techniques for teaching. Doing so, a small group of students work together as a team in order to achieve a common goal. This common goal was to understand all the statistical topics, to solve real statistical problems and to present one special statistical topic from the course to the classroom.

At the end of the course all students understood well the basic statistical ideas.
