"To DIE for!" - Declarative, Interrogative and Experiential Learning of (Geo)Science on the Web

Patrick James, Univ. of Adelaide, Australia

This project outlines a program including the development, delivery and evaluation over the last four years of online learning programmes to senior science and geoscience undergraduates within a larger Faculty and University Online development project. Lotus Domino was initially used as the software database engine to compile, manage, store and present the course materials. As an example, for one geoscience subject nearly 500 web pages have been compiled and delivered online to the students. Evaluations of this teaching and learning program indicate its overall acceptance and improvement in course delivery to students due to increased flexibility.
